

M & S AUTOMATED FEEDING SYSTEMS, INC.

SALES AND SERVICE ▯ VIBRATORY AND CENTRIFUGAL FEEDER BOWLS AND EQUIPMENT

M & S Automated Feeding Systems, Inc. has been designing and fabricating feeding and counting systems and interfacing these systems with packaging equipment like yours for several years now. We feed an incredible variety of parts such as simple screws and nuts, medical and dental parts, frozen foods and tiny brushes. We interface our systems with various baggers very successfully. Our customers express that we are "filling a gap" and have provided solutions and cost savings that they have needed. We build both centrifugal and vibratory feeder systems for these products and feed them at speeds from 10 parts per minute to 1400 ppm! We can also design and build the control panels to handle the logic and electrical interface between our feed systems and the bag forming systems if you or your customer would like. Our systems are priced very competitively, have a one year warranty and have been provided to our customers around the world for 15 years now. Our machines are drawn on CAD and we can provide these layouts in .DWG or .DXF, if requested. Since many of our feeders are custom designed for the specific parts to be fed, we can do many things that others can not.

DOUBLE BAGGER

Our goal is get our name and our specific service to potential customers. We do have sales reps however most of our sales have simply come from good word of mouth from our customers. Please, remember this is not the only type of feeding systems we construct so if you have any type of feeding need don't hesitate to get it touch. If you are interested in a quick quote please give us a call or check us out at www.msautomated.com! We have literature and videos available and we would love to help you out with your packaging needs.

Sincerely,

Mark L. Grinager
President
