

M & S AUTOMATED FEEDING SYSTEMS, INC.

SALES AND SERVICE ▯ VIBRATORY AND CENTRIFUGAL FEEDER BOWLS AND EQUIPMENT

We here at M & S Automated Feeding Systems design, fabricate and service automated packaging systems for disposable prophys. We have turned these designs into standard machines and are now marketing them to disposable prophy manufacturers such as you.

Our systems can handle several different styles of disposable dental prophys, such as brush heads or cup heads. The product is bulk loaded into our feeder systems, then our equipment will feed, orient and singulate the disposable prophys. Once the disposable prophys are singulated, we normally drop them into a vertical bag forming system purchased by either our customer or us. Our systems come complete with a control panel and PLC to insure that only one prophy is dropped into each bag. It can then be interfaced with the bag former to control each bag forming cycle. Our systems are capable of feeding up to 130 disposable prophys per minute accurately, reliably and economically. We have systems all over the world, they come with a one-year warranty and M & S Automated will provide installation training and service if requested.

M & S Automated Feeding Systems has also designed and built disposable prophy feeders and prophy paste feeders that feed one prophy and one package of prophy paste unto the bagging machine for a complete cleaning solution in one bag.

Our goal is to make you aware that this type of machinery exists and can be very profitable if implemented. If these or any of our other various custom feeding systems interest you, please give us a call, or visit our website at www.msautomated.com. We have literature and videos available and we would love to help you out with your feeding needs.

Sincerely,

Mark L. Grinager
President
